**Exciting** finding

Sobering news

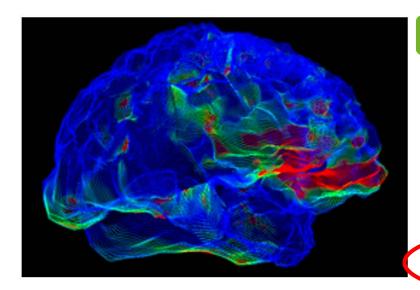

# Why Alzheimer's Drugs Keep Failing

Drug candidates have a 99.6 percent failure rate, and poor early detection methods make clinical trials difficult and costly

By Maria Burke, Chemistry World on July 14, 2014

Areas of cell loss are in red on this brain scan of an older person with Alzheimer's disease. Credit: NIH

## Challenges

- Understand disease pathophysiology and disease heterogeneity
- Diagnose early
- Get timing of treatment right
- Generalizability / translatability of animal models
- Robustness and reliability of preclinical data

## What is EQIPD?

First IMI consortium completely dedicated to improving preclinical data quality

Joint undertaking by Big Pharma, CROs, Academia, Technology Provider, and Scientific Associations

Proof of concept in Neuroscience and Safety, facilitated by a Quality Management System

Expand R&D-wide if successful

## **Our Vision**

Robust data and scientific rigor in animal studies will impact on the 3Rs, enhance the pace of knowledge gain and shorten the time needed to make new drug treatments available to patients

## **Internal Validity**

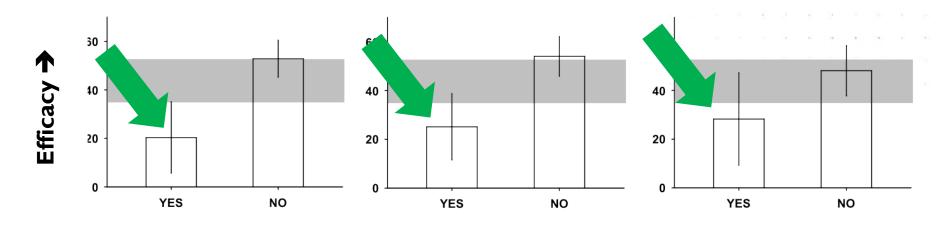

Animal studies not using RDN or BLD much more likely to be positive (n = 290) odds ratio 5.2 (95% CI 2.0-13.5)

BLD - / RND - vs

BLD + / RND +

Bebarta et al., Acad Emerg Med, 2003

**Randomisation** 

**Blinded conduct** of experiment

**Blinded** assessment of outcome

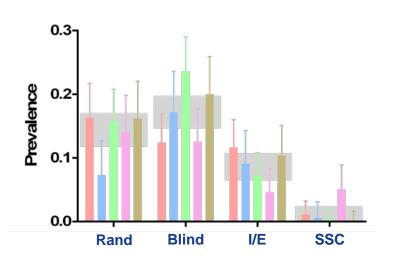

## Prevalence of risks of bias

#### SYSTEMATIC REVIEW

From a mouse: systematic analysis reveals limitations of experiments testing interventions in Alzheimer's disease mouse models

K.J. Egan, H.M. Vesterinen, V. Beglopoulos, E.S. Sena and M.R. Macleod3\*

| Random allocation to          | 67/427 | 16  |
|-------------------------------|--------|-----|
| group                         |        |     |
| blinded assessment of outcome | 95/427 | 22% |
| sample size calculation       | 0/427  | 0%  |

### reported efficacy was

- 3.4% higher in nonrandomized
- 5.8% higher in non-blinded studies

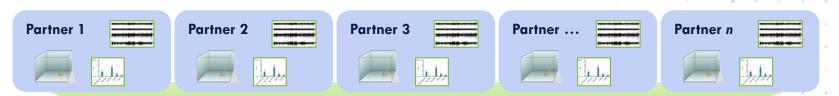

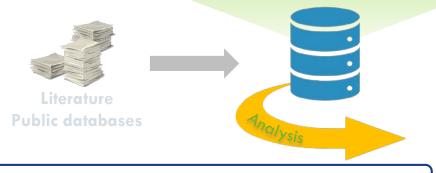

# **Historical Data Analysis**

Aim: Define variables of internal and external validity in experimental design, conduct and data analysis that are determinants of outcome in preclinical studies

Consortium data
(3 commonly used in vivo tests)

Open Field: 200 studies; Irwin: 18 studies; EEG: 401 studies

- Sample size
- Blinding
- Randomization
- ...
- ...

### **Research Guidelines**

Aim: Develop guiding principles and criteria governing rigor in experimental design, conduct and analysis of preclinical studies

Protocol for a systematic review of guidelines for rigour in the design, conduct and analysis of biomedical experiments involving laboratory animals

Jan Vollert, \*\*1 Esther Schenker, \*\*2 Malcolm Macleod, \*\*3 Anton Bespalov, \*\*4.5 Hanno Wuerbel, \*\*6 Martin Christian Michel, \*\*4.7 Ulrich Dirnagl, \*\*8 Heidrun Potschka, \*\*8 Kimberley E Wever, \*\*10 Thomas Steckler, \*\*11 Bruce Altevogt, \*\*12 Andrew S C Rice, \*\*1 on behalf of the EQIPD WP3 study group

- 13,863 papers screened
  - 62 papers finally included
  - 58 items extracted
- 2 Delphi rounds
- Consensus meeting
  - 33 items finally included

Evidence from validation studies

# **EQIPD Quality System: Overview**

Aim: Support the essential processes, procedures, responsibilities and cultural aspects relevant to implement the guiding principles that improve robustness of preclinical studies (using animals)

#### **TOOLBOX**

#### All information

- Everything related to research quality that a scientist may need to know about or have access to
- Created and maintained by EQIPD

#### **PLANNING TOOL**

#### Filter

#### **DOSSIER**

#### **Relevant information**

 Quality-related items, such as protocols and training records, that were developed by a research unit as solutions to challenges specific to their needs

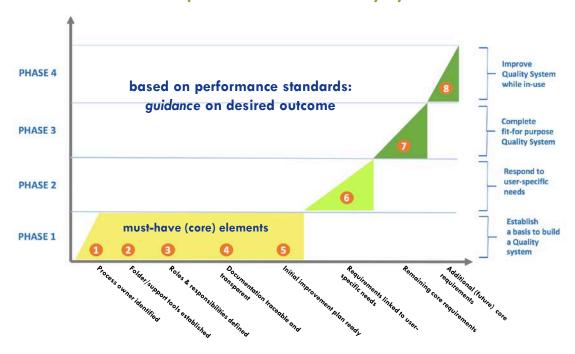

# Lean and Fit-for-Purpose System, Easy to Use Tools

#### Core Requirements of the Quality System

Version 1 rolled out May 2019

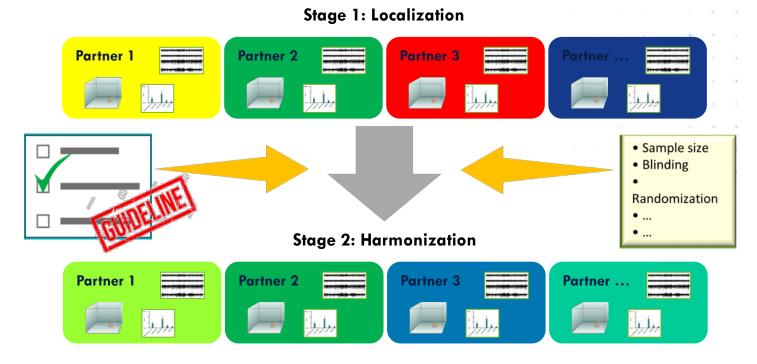

## **Cross-site Validation**

Aim: Validate the principles and research models that improve robustness and data quality in preclinical studies (using animals)

Effect of reduced inter-lab variability?

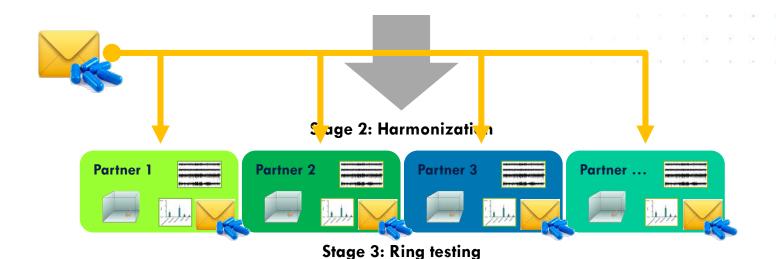

## **Cross-site Validation**

Effect of blinding of test item

Aim: Validate the principles and research models that improve robustness and data quality in preclinical studies (using animals)

## **Training Platform**

Aim: Maximize sustainability and impact of the EQIPD Quality System by development of an engaging learning environment to ensure research community wide expansion of knowledge about the EQIPD principles

- Evaluation of existing training modules
- User requirements identified
- Potential service providers to host the platform contacted

| Table 1: evaluated materials and included materials per module |                       |                                    |  |  |
|--|-----------------------|------------------------------------|--|--|
| Module   | # materials evaluated | # materials suitable for inclusion |  |  |
| Scientific integrity   | 0                     | 0                                  |  |  |

| 12:30  | 30 | Discussion: Stakeholders in research rigor: who is in the greatest need of higher research quality standards? E.g. industry,   | Thomas Steckler /<br>Malcolm Macleod |  |

## **Assets**

- 1. "Living" systematic review identifying primary research in AD
  - ~26,000 publications identified
- 2. Systematically curated guidelines for the conduct of animal experiments
- 3. Individual animal data from multi-site experiments
- 4. Ontology for describing animal experiments
  - Allows FAIR data sharing
- 5. Training platform and materials
  - Including materials from 2 Summer schools
- 6. The EQIPD Quality System
